

Plantation	Spacing	Benefits and drawbacks
Low density	400 to 1000 plants/ha	Enjoys plenty of light. Requires close supervision. The area around the larch must be thoroughly cleared for at least the first five years.
High density	1,300-1,600 plants/hectare on bare or prepared soil. In practice, plant around 1,100 plants/hectare.	Traditional plantation. Thorough thinning is required early on as the larch does not like competition. Rapid thinning out to achieve a density of 600-800 plants/hectare so that the crowns do not interfere with one another.

Sensitive to Armillaria

Larch canker
